No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                               3559

CCCCCCXXXXPTXXXX New gastrointestinal polynucleotides, CS198, and their detection - used for developing products for the diagnosis and treatment of gastrointestinal disorders, e.g. cancers, gastric ulcer or gastritis.

Claim 26; Page 100-102; 127pp; English.

This sequence represents the human CS198 protein which is used in a method to detect the presence of a target CS198 polynucleotide in a test sample. The CS198 gene is useful as a marker for gastrointestinal (GI) tract disorders. The methods and products can be used in detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition to diseases and conditions of the GI tract, such as GI tract cancer, Barret's ossophagus, gastric ulcer, gastritis, leiomyoma, polyps, Crohn's disease, and

The invention relates to a method of detecting the presence of a target CC S198 polynucleoride comprising contacting the test sample with at least one CS 198 specific polynucleotide. The method is useful for detecting CC one CS 198 specific polynucleotide. The method is useful for detecting CC diseases of the gastrointestinal (GI) tract organs, particularly cancer. CC The CS 198 polynucleotides, polypeptides and antibodies are useful for CC detecting, diagnosing, staging, monitoring, prognosticating, preventing, CC Ireating or determining predisposition to disease and conditions of the CG Itract such as cancer, gastric ulcer, gastritis, Crohn's disease, CC ulcerative colitis, pencreatitis and Barret's osophagus. The CS 198 CC polypeptides are useful as standards or reagents in diagnostic circumunoassays, as components or as target sites for various therapies. CC immunoassays, as components or as target sites for various therapies. CC immunoassays, as components or as target sites for various therapies. CC diagnostic tests and for screening for conditions or diseases associated CC with CS 198, particularly cancer. Monoclonal antibodies may also be used CC or the generation of chimeric antibodies for therapeutic use. The CS 198 polynucleotide is also useful in gene therapy and drug screening. The CC method of the invention provides an alternative, non-surgical diagnostic CC method capable of detecting early stage GI tract disease such as cancer. The present sequence is human CS 198 polypeptide

                                                                                                                                                                                                                                                                                                                                                        comprises
detecting
                                                                                      The invention describes a method of detecting the presence of a target CS198 polynucleotide in a test sample. The method comprises contacting the test sample with at least one CS198 specific polynucleotide or its complement, and detecting the presence of the target CS198 polynucleotide in the test sample, where the CS198-specific polynucleotide has at least 50% identity to a polynucleotide having any of the 27 fully defined sequences of 34-2894 bp (S1-27) given in the specification, or their fragments or complements. The composition and methods are useful in diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition of an individual to, diseases and conditions of the gastrointestinal tract, e.g. cancer and in gene therapy. This is the predicted amino acid sequence of the human CS198 protein derived from the CS198 consensus sequence shown in seq id 27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δ
The invention relates to reagents and methods for detecting diseases of the gastrointestinal (GI) tract. The method involves detecting the presence of target CS198 polynucleotide in the test sample. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CS198 polypeptide, such as cancer
                                                                                                                                                                                                                                                                                                                                                               Billingel

                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel human nucleic acid sequence of the gancreas and its encoded protein. The invention further comprises:

CC proteins and peptides, preferably isolated, that contain a sequence concerned by the novel nucleic acid, and methods for diagnosis and treatment of pancreatic cancer, using a substance that inhibits or binds content protein or its DNA, including: an antisense oligonucleotide, short content molecule, particularly having a molecular weight below 5000, concerned by the pancreatic DNA, an aptamer or congenic molecule, particularly having a molecular weight below 5000, concerned by the pancreatic DNA, an aptamer or concerned by the pancreatic protein and the may be derivatized with a reporter concerned by the novel may be derivatized with a reporter concerned by the novel sequence and their encoding DNA have cytostatic compound, immunostimulant and/or radioisotope. The novel cancer. This sequence are useful for inhibiting transcription concerns of the invention. Note: This sequence is not shown in the pacification, it has been electronically downloaded from a DVD-rom concerning the pacification by the European Patent Office.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activinyinhbin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim

                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                            The present invention relates to human NC1, NC2 and NC3 proteins and coding sequences (ADG14340-ADG14345). The coding sequences are useful for detecting and screening proliferative insulin-producing cells as well as differentiation and proliferation of such cells and their precursors as analogous cells in treatment of e.g. PHHI and diseases due to differentiation/proliferation abnormality, diseases of the nervous system and pancreas. The coding sequences are also useful as spontaneous proliferation models of pancreas beta-cells. The novel genes NC1, NC2 and NC3 were isolated from the pancreas of PHHI patients, which were used in testing for the detection of proliferative insulin-producing cells or pancreas beta-cells by Northern analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Familial persistent hyperinsulinemic hypoglycemia of infancy (PHHI) patient-expressed genes for detecting and screening e.g. proliferatinsulin-producing cells in treatment of PHHI.
                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1;

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

                                                                                                                                                                                                                                                                                                    is used in a method to detect the presence of a target CS198 protein which polynucleotide in a test sample. The CS198 gene is useful as a marker for gastrointestinal (GI) tract disorders. The methods and products can be used in detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition to diseases and conditions of the GI tract, such as GI tract cancer, Barret's oseophagus, gastric ulcer, gastritis, leiomyoma, polyps, Crohn's disease, ulcerative colitis, and pancreatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New gastrointestinal polynucleotides, CS198, and their detection - for developing products for the diagnosis and treatment of gastrointestinal disorders, e.g. cancers, gastric ulcer or gastriti

CC CS 198 polynucleotide comprising contacting the test sample with at least CC one CS 198-specific polynucleotide. The method is useful for detecting CC diseases of the gastrointestinal (GI) tract organs, particularly cancer. The CS 198 polynucleotides, polypeptides and antibodies are useful for CC treating or determining predisposition to disease and conditions of the CS 198 polynucleotides, polypeptides and antibodies are useful for CC treating or determining predisposition to diseases and conditions of the CS Intract such as cancer, gastric ulcer, gastritis, Crohn's disease, CC ulcerative colitis, pancreatitis and Barret's oesophagus. The CS 198 polypeptides are useful as standards or resgents in diagnostic communoassays, as components or as target sites for various therapies. CC Antibodies directed against at least one epitope contained within these polypeptides are useful as delivery agents for therapeutic agents, in CC diagnostic tests and for screening for conditions or diseases associated CC with CS 198 particularly cancer. Monoclonal antibodies may also be used for the generation of chimeric antibodies for therapeutic use. The CS 198 polynucleotide is also useful in gene therapy and drug screening. The method of the invention provides an alternative, non-surgical diagnostic method capable of detecting early stage GI tract disease such as cancer. The present sequence is C-terminal portion of human CS 198 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CS 198; gastrointestinal tract disease; GI tract; cancer; gas

The invention describes a method of detecting the presence of a target CS198 polynucleotide in a test sample. The method comprises contacting the test sample with at least one CS198 specific polynucleotide or its complement, and detecting the presence of the target CS198 polynucleot.
                                                                                                                                                                                                                                                                                                                   31-MAR-1997;

The composition and methods are useful in diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition of an individual to, diseases and conditions of the gastrointestinal tract, e.g. cancer and in gene therapy. This is the amino acid sequence of a synthetic peptide based on the predicted human CS198 protein sequence derived from the CS198 consensus sequence shown in seq id 27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to reagents and methods for detecting diseases of the gastrointestinal (GI) tract. The method involves detecting the presence of target CS198 polynucleotide in the test sample. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CS198 polypeptide, such as cancer of the gastrointestinal tract. These are also useful in gene therapy. The present sequence is a CS198 protein used to illustrate the method of the

Nucleic acids encoding 4277 human colon cancer-associated useful for preventing, diagnosing and/or treating colorect
Claim 11; Page 6550-6551; 9803pp; English
                                                                               sociated polypeptides, colorectal cancers.
```

cancer-associated nucleic acid molecules (N) and proteins (P), where the CC proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy CC and vaccine production. N and P may be used in the prevention, diagnosis CC example, N and P may be used to treat disorders associated with inappropriate P expression. For CC example, N and P may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids CC into a host cell and culturing the cell to express the proteins. N and P CC can be used in the prevention, diagnosis and treatment of colorectal CC carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent CC sequences used in the exemplification of the present invention. N B. CC Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 CC to 1052, 7921 and 7922 Sequence 172 AA;

The sequences are useful for: (i) for screening of bloactive agent capable of binding to Carcinoma Associated Protein (CAP); (ii) for screening of a bioactive agent capable of modulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (iv) for treating carcinoma; (vii) for neutralizing the effect of CAP; (ix) as a biochip; carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (x) for diagnosing carcinoma or a propensity to carcinoma, and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as markers of carcinoma including lymphoma. The present sequence is one such CAP. Note This patent is an equivalent to basic patent US2002182586A1, for which me the cap are useful as markers of carcinoma including lymphoma. The present sequence is one such CAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 5; SEQ ID NO 1320; Opp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant nucleic acid useful for diagnosis and treatment of carcinoma comprises a nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-MAR-2002; 2002US-00087192

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

us polyposis coli protein - human

te names: polyposis coli locus protein DP2.5; tumor suppressor APC

Homo sapiens (man)

1-Dec-1991 #sequence revision 31-Dec-1991 #text\_change 09-Ju1-2004

on: A37261; B39658; A44928; A49319; I54271
